

Manage the online security of your workforce with confidence.

Users are more mobile than ever, and cyber threats are becoming more sophisticated. Employees work from many locations, have multiple devices, and no longer require a VPN to access what they need. With users accessing cloud applications and the Internet directly, it can feel overwhelming to try and safeguard all your network assets against malicious activity.

With FirstLight DNS Protection, you can protect your users regardless of their location or device, without adding another appliance or deploying endpoint security. Most importantly, your users won't have to sacrifice performance for security.

FirstLight offers flexible, DNS-layer security to enrich incident response data and easily extend protection to all devices. Because FirstLight DNS Protection is delivered from the cloud, it can protect users everywhere in minutes.

Why DNS Security?

DNS is a fundamental building block in connecting to the Internet. It translates easily remembered names into machine language that devices need to connect to the services used daily.

FirstLight DNS Protection uses a foundational building block in the Internet's infrastructure to filter out malicious and unwanted domains, IP addresses, and cloud applications before a connection is ever established. Built 100% in the cloud, it provides better accuracy and detection of compromised systems — improving security, visibility and network protection.

Benefits

- See all internet traffic across users
- Easily enforce content web filtering
- Block attacks earlier
- Manage and block cloud apps
- Contain malware
- Gain context for faster investigation

Here's How:

DNS and IP layer Enforcement

Uses DNS to stop threats over all ports and protocols—even direct-to-IP connections. Stops malware earlier and prevents callbacks to attackers in infected machines connected to your network.

Web Security via Selective Proxy

Routes requests to risky domains to a selective proxy for deeper URL and file inspection. Effectively protects without delay or performance impact.

App Discovery and Blocking

Provides visibility into cloud apps used across your organization, so you can identify potential risks and block specific applications easily.

Deploy and Configure in Minutes

FirstLight DNS Protection is easy to deploy. There is no hardware to install or software to update, and the browser-based interface process allows for quick setup and ongoing management. Plus, FirstLight's engineers are with you every step of the way.

On-network Coverage

- With one setting change
- Integrated with Cisco SD-Wan, Cisco ISR 1K and 4K series, Cisco Meraki MR and Cisco WLAN controllers

Off-network Laptop Coverage

- With AnyConnect VPN client integration
- Or with any VPN lightweight Umbrella client
- Or with Umbrella Chromebook client

Off-network mobile coverage

- With Cisco Security Connector

Network Assurance Enables Your Business

FirstLight's Network Assurance helps you deploy your solutions quickly and correctly – the first time. We guide you every step of the way to ensure you take advantage of the services you subscribe to.

Don't have time to manage yet another service? Network Assurance provides 24x7 support and ongoing management so you can get back to what you do best – driving your organization forward.
